FRONT PAGE · SECURITY & THE TWO-SPEED STATE

A Zero-Day Hit a Turkish Defense Org Before Microsoft Knew

A Windows flaw was already being exploited against a major Turkish defense organization before a patch existed. The gap between first use and public fix is the whole story — and it is widening.

Türkiye is running two economies at once, and the gap between them is the week's real story. Headline inflation eased in July, yet the underlying pressure climbed — so rate-cut hopes dimmed and S&P trimmed its year-end forecast. With one hand the state tightens; with the other it hands out interest-free AI credit, cancels student-loan interest, and sells Kocaeli land below market. Down in Kocaeli, residents read the fine print and shouted down an urban renewal plan as 'taking from the poor, giving to the rich.' Meanwhile the grid quietly tilts clean, a German lab pushes sunlight-to-hydrogen past 31% in a stack, and a Windows zero-day hit a Turkish defense org before Microsoft knew. The security perimeter leaks while the tools to defend it go open-source. Follow the material flows — energy, money, trust — and the seams show.

A kidney drug holds the line on IgA nephropathy — if the two-year data survives scrutiny

Otsuka Pharmaceutical · 2026-08-04

Otsuka's VOYXACT (sibeprenlimab-szsi) kept kidney function decline at baseline physiologic rate over two years in a Phase 3 trial of IgA nephropathy patients.

The VISIONARY trial's two-year results, released August 4, show the drug stabilized the estimated glomerular filtration rate — the standard measure of kidney function — at what the company calls the baseline physiologic rate. That matters because IgA nephropathy is a slow, relentless disease that typically marches toward dialysis. The company frames the result as "fundamentally altering disease progression." Read the fine print: this is a press release, not a peer-reviewed paper, and "baseline physiologic rate" is the company's own framing of the numbers. Independent readout and regulatory review will decide whether the stabilization is real and durable. Still, a drug that holds the

German lab pushes sunlight-to-hydrogen past 31% — in a stack, not a field

Energy Daily / Fraunhofer ISE · 2026-08

Fraunhofer ISE converted sunlight directly to hydrogen at 31.3% efficiency outdoors, more than double the typical yield of such systems.

The German institute stacked semiconductor cells to split water with sunlight at 31.3% efficiency in outdoor conditions. Typical solar-to-hydrogen setups manage roughly half that. The trick is a stacked cell that harvests more of the spectrum. The number is a lab record, not a commercial product — scaling it from a bench stack to a plant is where most such records die. But the direction is real: direct solar hydrogen, no electrolyzer, no grid. The gap between headline and hardware is the usual one — record efficiency in a controlled stack versus cost and durability in the field. Worth watching, not worth betting the farm.

ACC 85% | BIAS 10% | MID

line on kidney function for two years is not theater. For a disease with few good options, that is a genuine signal.

ACC 80% | BIAS 15% | MID

Türkiye's grid quietly tilts toward clean power — the numbers say so

Ember · 2026

Türkiye's electricity mix is shifting toward renewables, with clean power growth positioning the country for the next phase of its energy transition, per Ember's 2026 review.

Ember's Türkiye Electricity Review 2026 documents a grid in motion. Renewables are taking a growing share of generation, and the BloombergNEF factbook echoes the point: clean power growth positions Türkiye for the next phase of its transition. The honest caveat: "positioned for" is not "arrived at." Coal still holds a large share, and the pace depends on grid investment and storage. But the direction is measurable, not aspirational. For a country that imports much of its energy, each percentage point of domestic renewables is also a balance-of-payments story. The data is out; the build-out is the test.

ACC 80% | BIAS 20% | MID

READING THE SCORES

Accuracy (0-100%) — how well the story's claims are supported by its cited source and internal evidence. Low scores

mean the piece is unverified, self-contradictory, or stretches beyond what its own text supports; the Fact-Checker cannot run

live searches, so nothing is ever marked fully 'verified'.

Bias (0-100%) — degree of slant, with 0 = neutral. Higher values flag charged framing or a one-sided reading of the

facts.

Credibility — LOW / MID / HIGH, the source's track record as judged from the story's own citation. These are heuristic,

not gospel: treat them as a prompt to read critically, not as a verdict on the truth.

A solar cell that shrugs off radiation earns its space legs

Perovskite-Info · 2026-08

A perovskite/silicon tandem solar cell hit a certified 27.49% efficiency under space conditions and survived radiation plus a real high-altitude balloon flight.

Researchers certified a perovskite/silicon tandem at 27.49% efficiency in space-like conditions, then sent it up on a high-altitude balloon and watched it survive the radiation. That combination — efficiency plus radiation tolerance — is what space solar needs. Perovskites have long promised cheap, efficient cells but carry a reputation for fragility; surviving a balloon flight and radiation exposure is the kind of evidence that moves them from lab curiosity toward orbit. The gap: certified efficiency in test conditions is not the same as years of operation in orbit, and space qualification is a long, unforgiving process. But a cell that takes a beating and keeps its numbers is a real step, not a press release.

THE BIG PICTURE — THIS WEEK'S CROSS-SIGNALS

Two Hands, One State

The central bank's credibility rests on holding rates, but the political economy keeps spending. July's headline cooling hides a hotter core: S&P cut its year-end rate forecast, rate-cut hopes dimmed, and Erdoğan canceled student-loan interest — a real-terms windfall with a catch. The same week, KOSGEB opened interest-free AI credit up to 5 million lira. The state tightens with one hand and subsidizes with the other, and the contradiction lands hardest where money is tightest.

Signals: macro-money · opportunity-perk-radar · teşkilat-ı düzen (Kocaeli: Who Bears the Cost)

Kocaeli Reads the Fine Print

The same state that sells Kocaeli dirt below market and pays half your renovation bill also scrapped a 142-bus, 70-line transport tender and faces residents shouting that urban renewal takes from the poor and gives to the rich. Subsidy and extraction are two faces of one ledger, and the crowd in Kocaeli has learned to read it. The bill-reducing support and renovation money both carry fine print — which is where the real policy lives.

Signals: *Underground Alpha & Arbitrage · teşkilat-ı düzen (Kocaeli: Who Bears the Cost) · teşkilat-ı düzen (Kocaeli Signal)*

Trust Is the Scarce Resource

A zero-day hit a Turkish defense org before Microsoft knew; a Coldcard flaw fed a \$70 million Bitcoin theft in 41 minutes; Thermo Fisher patched a flaw that made DNA tampering nearly invisible; the FCC pulled foreign robots and power inverters. In the same week, the tools to keep code in-house — Tabby's self-hosted assistant, open-weight models like Mizan-27B — went mainstream. When trust is the scarce resource, self-hosting is the posture.

Signals: *Dark-Horse Geopolitics & Cyber · open-source-ai-tools-radar*

The Grid Goes Clean, One Stack at a Time

Türkiye's grid quietly tilts toward clean power, a German lab pushed sunlight-to-hydrogen past 31% in a stack rather than a field, and a radiation-proof solar cell earned its space legs. The energy transition is real, but it is incremental and material — cells, stacks, grids — not a revolution announced in a press release. This is the material base the rest of the week's noise sits on top of.

BREAKTHROUGHS & PROGRESS

What actually moved this week — and what didn't

This week's genuine progress clusters around energy — a solar-to-hydrogen lab record, a radiation-hardened tandem cell, and Türkiye's measurable grid shift — plus one solid clinical signal in kidney disease. The rest is press-release theater.

Connecting dots: The solar-to-hydrogen and perovskite tandem stories feed directly into the Türkiye grid story: the clean-power build-out Ember documents depends on exactly the cell and storage advances these labs are chasing. The Otsuka kidney result plugs into the edition's medical beat as a rare Phase 3 signal worth independent scrutiny.

A kidney drug holds the line on IgA nephropathy — if the two-year data survives scrutiny

Otsuka Pharmaceutical · 2026-08-04

Türkiye's grid quietly tilts toward clean power — the numbers say so

Ember · 2026

Türkiye's electricity mix is shifting toward renewables, with clean power growth positioning the country for the next phase of its energy transition, per Ember's 2026 review.

Ember's Türkiye Electricity Review 2026 documents a grid in motion. Renewables are taking a growing share of generation, and the BloombergNEF factbook echoes the point: clean power growth positions Türkiye for the next phase of its transition. The honest caveat: "positioned for" is not "arrived at." Coal still holds a large share, and the pace depends on grid investment and storage. But the direction is measurable, not aspirational. For a country that imports much of its energy, each percentage point of domestic renewables is also a balance-of-payments story. The data is out; the build-out is the test.

ACC 80% | BIAS 20% | MID

SECTION MACRO-MONEY

THE LIRA'S TWO-SPEED DISINFLATION

Headline inflation cools while the underlying monthly pressure builds — and the TCMB stays on hold.

Headline Turkish inflation eased in July while seasonally adjusted monthly pressure picked up, keeping the central bank on hold and dimming rate-cut expectations — a split that leaves lira savers with elevated deposit yields but no clear easing timeline.

| Connecting dots: The TCMB's hold and the dimming cut expectations connect to the local beat: with real deposit rates staying high, households' purchasing-power workarounds — campaign tracking, debt restructuring — become the practical counterweight to a currency that keeps drifting.

solar-to-hydrogen setups manage roughly half that. The trick is a stacked cell that harvests more of the spectrum. The number is a lab record, not a commercial product — scaling it from a bench stack to a plant is where most such records die. But the direction is real: direct solar hydrogen, no electrolyzer, no grid. The gap between headline and hardware is the usual one — record efficiency in a controlled stack versus cost and durability in the field. Worth watching, not worth betting the farm.

Turkish inflation eases in July, but the underlying pressure picks up

ING THINK · 2026-07-31

Turkish annual inflation eased in July, but seasonally adjusted monthly pressure accelerated — the kind of split that keeps the central bank's hand tied.

ING's snap on the July print shows headline CPI undershooting while seasonally adjusted inflation accelerates. Governor Karahan insists 'disinflation is strengthening.' The market reads the tea leaves differently: rate-cut expectations have dimmed. The split matters because headline numbers flatter; underlying momentum is what the MPC actually watches. For anyone holding lira deposits, the real question is whether the policy rate stays ahead of the monthly run-rate. Too early to call the next move; the July print complicates the easing path survey respondents had penciled in. Both readings are sourced; neither settles the argument.

ACC 85% | BIAS 10% | HIGH

S&P lowers its year-end interest rate forecast for Türkiye

Bazaar Times · 2026-07-25

S&P trimmed its year-end policy rate forecast for Türkiye, tracking the disinflation path — but the number is a scenario, not a promise.

S&P trimmed its year-end policy rate forecast for Türkiye, per Bazaar Times. The revision tracks the disinflation path and the central bank's gradual stance. But S&P has revised its Turkish rate calls more than once, so treat the number as a scenario, not a promise. The direction matters more than the level: markets now price a shallower easing cycle than they did in spring. For savers, that means lira deposit rates stay elevated longer — a real-terms cushion against the currency's drift. The forecast is a bet on the disinflation holding; the July underlying print is the main risk to it.

ACC 80% | BIAS 10% | MID

SECTION MENTAL-MODELS

THE DECISION TOOLS THAT ACTUALLY PAY RENT

Two frameworks for people who want to decide, not just collect

This week's mental-models material splits into two camps: collectors who hoard frameworks and practitioners who actually apply a few. The useful pieces converge on one point — a model is only worth what it changes in a real decision.

Rate-cut expectations dim as inflation risks linger in July

Türkiye Today · 2026-07-28

Expectations for a Turkish rate cut in July are fading, even as the central bank's own survey shows improving inflation and lira forecasts.

Türkiye Today reports expectations for a July cut fading. BBVA's July policy pulse says 'on hold for now, gradual easing still expected.' The central bank's own market participants survey showed improving inflation and USD/TRY forecasts, but the underlying monthly pressure argues for patience. The tension: survey optimism versus seasonally adjusted reality. Cut too early and expectations re-anchor upward; wait too long and the lira strengthens on carry. Both sides have sources; neither has certainty. The honest read is a shallower, slower easing cycle than spring pricing implied.

ACC 82% | BIAS 15% | MID

Erdoğan cancels student loan interest — a real-terms windfall, with a catch

Erudera · 2026-07-20

The government will cancel interest on student loans, a genuine relief for borrowers whose lira debt was compounding faster than their salaries.

President Erdoğan announced the government will cancel interest on student loans, per Erudera. For borrowers this is a genuine real-terms windfall: with inflation in double digits, accrued interest on lira-denominated student debt was compounding faster than most salaries. Cancelling it converts a liability growing in real terms into a fixed principal. The catch: the policy is discretionary, announced by decree, and reversible. Anyone holding such debt should treat the cancellation as a one-off, not a structural fix — and keep principal payments current. The relief is real; the permanence is not guaranteed.

ACC 78% | BIAS 20% | MID

| *Connecting dots: The Brad Jacobs piece on decisive action under uncertainty connects to the macro beat's theme of speed in volatile markets, while Commoncog's warning against model-hoarding echoes the cyber beat's caution about accumulating tools without ever deploying them.*

Decide Fast, Commit Hard: Brad Jacobs on Billion-Dollar Calls

Farnam Street · 2025

Brad Jacobs has built four billion-dollar companies by refusing to wait for perfect information.

Jacobs runs on a simple rule: the cost of a slow decision usually exceeds the cost of a wrong one. He built United Rentals, XPO, and others by treating speed as a feature, not a risk. His framework has three moves. First, decide fast: set a hard deadline and gather only the facts that would actually change the call. Second, commit fully: once the decision is made, stop revisiting it, because a half-committed team executes worse than a wrong-but-committed one. Third, treat reversibility as an asset — if you can unwind it cheaply, decide now and adjust later. The tool is not about recklessness; it's about pricing the cost of delay into every choice. Most people overvalue accuracy and undervalue momentum. Jacobs flips that. How to use it this week: take the decision you've been deferring, give it 48 hours, decide, and refuse to reopen it.

ACC 72% | BIAS 10% | MID

Mental Models Are Useless Until You Use Them

Commoncog · 2024

Commoncog's FAQ makes one uncomfortable point: most people who collect mental models never actually use them.

Knowing the name of a model is not the same as wielding it. The FAQ separates two kinds of knowledge — declarative, where you can name the model, and applied, where you can use it under pressure. The tool is to shrink your list. Instead of hoarding 100 models, pick the handful you genuinely understand and practice running real decisions through them until the habit sticks. The FAQ also flags the trap of model-flavored rationalization: using a framework to justify a decision you already made. A model earns its keep only when it changes your answer. That's the test. Most of the mental-models genre is inventory; this piece is the rare one about operation. How to use it this week: take one live decision and force it through two or three models you actually understand — not the hundred you've bookmarked — and see if your answer changes.

ACC 74% | BIAS 10% | MID

SECTION TEŞKİLAT-I DÜZEN

KOCAELI SIGNAL: MUNICIPAL FRICTION & CONSUMER ALERTS

Planned outages, a contested renewal plan, a bill-support program with fine print, and one hate-threat incident

This week's Kocaeli signal is dominated by municipal friction: scheduled power cuts, a contested urban renewal plan, and a bill-support program whose fine print matters more than its headline. One hate-threat incident against a local business shows the social temperature running alongside the administrative noise.

| *Connecting dots: The urban transformation backlash connects straight to the macro housing-and-debt beat: the same 'small home, big loan' knot that has tied up Kadıköy is the engine of the distrust voiced at the municipal meeting. The bill-support fine print, meanwhile, is a consumer-warning thread that local and macro beats both feed.*

Nine Kocaeli districts brace for outages that could stretch eight hours

Özgün Kocaeli · 2026-07-29

Kocaeli's electricity distributor has scheduled maintenance cuts across nine districts, with some windows running up to

Kocaeli residents shout down urban renewal plan as 'taking from the poor, giving to the rich'

Nokta Gazetesi · 2026-07-29

eight hours.

This is a planned disruption, not a failure. The utility posted the schedule ahead of time, so residents in affected neighborhoods can plan around it — charge the phones, stock the fridge, and check the posted window before assuming the worst. The alert is reported and verified through the distributor's official notice; there is no unverified panic here. The practical takeaway is boring and useful: read the posted times for your specific district, because the eight-hour figure is the ceiling, not the norm. And don't trust secondhand versions of the schedule circulating on local forums — the official list is the only one that counts. A long outage is an inconvenience; a wrong assumption about when it starts is how you lose the groceries.

ACC 88% | BIAS 5% | HIGH

Kocaeli's bill-reducing support opens applications — with fine print

Kocaeli TV · 2026-07-29

Kocaeli has opened applications for a support program meant to lower household bills, and the details matter more than the headline.

The program targets specific income brackets, and the application window is finite. Local coverage flags 'critical details' — which is editor-speak for eligibility being narrower than it sounds and the deadline being real. Miss it and you lose the benefit. This is a reported, official program, not a rumor; the terms are published. But the fine print is where residents get burned, so read the criteria before assuming you qualify. The pattern is familiar: a support scheme announced loudly, then quietly gated by paperwork and a cutoff. The signal for readers is not the existence of the program but the discipline required to actually collect it.

ACC 82% | BIAS 10% | MID

SECTION TEŞKILAT-I DÜZEN — DARK-HORSE GEOPOLITICS & CYBER

DARK-HORSE GEOPOLITICS & CYBER

Zero-days, supply-chain trust, and the quiet fights nobody headlines

This week's dark-horse picks all circle one theme: trust in the hardware and software you didn't build. A Windows zero-day aimed at a Turkish defense contractor, an FCC ban on foreign robots, a DNA-file flaw, and a \$70 million hardware-wallet heist each expose a different seam in the supply chain.

At a Kocaeli Metropolitan Municipality urban transformation meeting, residents pushed back hard — one chant framing the project as 'taking from the poor and giving to the rich.'

The complaint is specific: renewal terms that leave small homeowners carrying big debt. This is reported sentiment from a public meeting, not a rumor — the quotes are on the record and attributed. The underlying worry is the same one that has knotted up Kadıköy, where transformation has become a tangle of small homes and large loans. Whether the numbers justify the anger is a separate question; the distrust itself is real and documented. What the meeting reveals is that the fight is no longer about whether renewal happens, but on whose terms. Residents are not objecting to the idea of safer buildings — they are objecting to a deal they read as transferring value upward.

ACC 80% | BIAS 25% | MID

Kocaeli photo studio hit with homophobic threats after posting a shoot

Kaos GL · 2026-07-29

A photo studio in Kocaeli received homophobic threats after sharing a shoot, according to Kaos GL's report.

The threats are reported and attributed; the studio's account is the source. What is notable is how fast a local business became a target over content that should be routine. This reads as a consumer-facing warning in the sense that it signals a hostile climate for businesses that post inclusive work — a signal the news cycle tends to miss. It is reported, not anecdotal, but the scale of the backlash beyond the initial threats is unverified. Treat the incident as confirmed and the reach as unknown. For local shop owners, the practical lesson is blunt: a single post can draw a coordinated response, and having a record of it matters.

ACC 78% | BIAS 15% | MID

| *Connecting dots: The Turkish defense zero-day is the cleanest bridge to the geopolitics beat — state-backed espionage burning an expensive bug against a NATO-adjacent contractor is the same playbook the macro section tracks in Ankara. The FCC robot ban connects to the regulatory/local beat on who gets to control the physical layer of the internet.*

Windows Zero-Day Hit a Major Turkish Defense Org Before Microsoft Knew

The Record from Recorded Future News · 2026-08-04

Microsoft and CISA went public with a Windows zero-day that attackers had already used against a major Turkish defense organization — before a patch existed.

The bug landed in CISA's Known Exploited Vulnerabilities catalog, which is the agency's way of saying: assume it's in your network. Microsoft patched it only after the intrusion surfaced, and the timing tells you who was willing to burn an expensive exploit for access. Turkish defense firms have been a recurring target for state-backed espionage, and a zero-day aimed at one of them is a signal about priorities, not a one-off. Severity is high; affected systems are Windows deployments across the contractor's supply chain. The patch is out, but incomplete coverage is the real risk — most shops still run a lagging fleet. Practical mitigation: treat any Turkish defense-adjacent vendor as a likely target, hunt for post-exploitation artifacts rather than waiting for the next advisory, and rotate credentials on anything that touched the affected systems. Credibility is solid — this is a coordinated CISA/Microsoft disclosure, not a rumor mill.

ACC 85% | BIAS 10% | HIGH

Thermo Fisher Patches a Flaw That Made DNA Tampering Nearly Invisible

The Hacker News · 2026-08-02

Thermo Fisher patched a flaw that could make tampering with DNA files nearly undetectable — a biosecurity gap most security teams never had on their radar.

The vulnerability sat in the kind of software nobody thinks to audit: the tools that read and process genetic data. An attacker who could reach those files could alter them in ways that pass routine checks, which matters when the output feeds diagnostics, forensics, or biomanufacturing. The patch is out, and that's the good news. The uncomfortable part is that the affected systems live in labs and clinics where patching is an afterthought and where the staff who run them are not thinking about adversaries. Severity is high for anyone handling sensitive genetic data; affected systems are Thermo Fisher's sequencing and analysis platforms. Practical mitigation: isolate DNA-processing machines from the general network, verify file integrity against a trusted baseline, and treat any lab instrument with network access as a potential entry point. Credibility is solid — this is a vendor disclosure with a real patch, though the real-world exploitability is unproven and probably overstated by

FCC Pulls the Plug on Foreign Robots and Power Inverters

The Hacker News · 2026-07-28

The FCC moved to block new foreign-produced robots and power inverters from the U.S. market over cyber risks — a quiet regulatory swing with a loud supply-chain echo.

The commission cited cyber risks, which is a polite way of saying it no longer trusts the firmware in cheap connected hardware. Robots and power inverters are the unglamorous backbone of factories and grids, and both have a habit of shipping with hardcoded credentials and no update path. Blocking them at the border is a blunt instrument, but it's the only one that reaches devices most owners will never patch. The move is under-covered because it's not a breach and not a headline — it's a trade policy dressed as a safety rule. Expect pushback from importers and manufacturers who argue the ban is protectionism wearing a firewall. Credibility is high on the action itself; the stated motive is official, though the geopolitical subtext is left unsaid. For anyone running a facility on foreign inverters, the practical read is simple: start planning a domestic or vetted alternative before the installed base becomes a liability.

ACC 75% | BIAS 25% | MID

A Coldcard Flaw and a \$70 Million Bitcoin Theft in 41 Minutes

The Hacker News · 2026-08-03

A flaw in Coldcard hardware wallets is linked to a \$70 million Bitcoin theft that took 41 minutes — the kind of heist that makes 'cold storage' feel like a marketing term.

Hardware wallets are supposed to be the vault: keys never leave the device. This one got cracked fast enough that the attackers drained seven figures a minute. The exact mechanism is still being picked apart, and the vendor's response — a patch and a lot of careful wording — is worth reading with skepticism until independent researchers confirm the root cause. What's clear is that the threat model shifted. If a device built specifically to resist compromise falls in under an hour, then the gap is not in the silicon but in how people use it: firmware updates, seed handling, and the assumption that 'offline' means 'safe.' Severity is critical for large holders; affected systems are specific Coldcard firmware versions. Practical mitigation: update firmware, rotate to a fresh wallet if you suspect exposure, and stop treating any single device as the whole answer. Credibility is moderate — the theft is reported, but the causal link to the flaw is vendor-adjacent and not yet

the scare headlines.

KOCAELI: WHO BEARS THE COST

Indictments, empty seats, displacement fears, and a bus network in limbo

This week's Kocaeli stories share one question: who pays. A national opposition leader faces an indictment, students lose university seats, residents fight displacement, and commuters wait on a canceled bus tender.

Connecting dots: The urban-transformation and TOKİ housing stories feed the macro housing-affordability beat, while the university quota cuts track the national demographic and education-policy story running elsewhere in this edition.

CHP leader Özgür Özel hit with 'chain bribery' indictment

Kocaeli Gazetesi / Özgür Kocaeli · 2026-08-04

A parliamentary indictment accusing CHP leader Özgür Özel of 'chain bribery' has been filed, Kocaeli outlets report.

The fezleke, carried by Kocaeli Gazetesi and Özgür Kocaeli, alleges a pattern of bribery. The timing and the framing split along predictable lines. Government-aligned outlets present it as a corruption case against the main opposition leader; opposition-aligned outlets call it political targeting. Both are partly right: it is a real legal instrument, and it lands on a man who has made anti-corruption a campaign plank.

What the headlines don't say: a fezleke is a preliminary step, not a conviction. Whether it becomes a trial, and what evidence survives scrutiny, is unverified and too early to call. The document's contents have not been published in full, so the specific allegations remain thin in the public record.

The case will test how far a legal process can go before it reads as politics, and how far political noise can go before it reads as a legal process. For now, both readings are live.

ACC 80%BIAS 15%MID

Kocaeli still turns out 9 of every 20 cars made in Türkiye

Anadolu Agency · 2026-08-02

Nine of every 20 vehicles produced in Türkiye roll out of Kocaeli, and the province kept its industrial lead in the first half of the year.

Anadolu Agency data shows Kocaeli holding its weight in the auto sector through the first six months. The province anchors Türkiye's biggest car plants and a dense supplier network that feeds the national

YÖK prunes Kocaeli University quotas in 13 faculties

Özgür Kocaeli / En Kocaeli · 2026-08-03

Kocaeli University will admit fewer students next year, with quotas cut in 13 faculties and 8 vocational schools.

Only one faculty kept its numbers. The cuts follow a national YÖK 'tırpan' — a pruning across Turkish universities driven by falling demand and a shrinking 18-year-old cohort.

For Kocaeli, a city that leans on its university as an economic and social engine, fewer seats means fewer students spending in the local economy. Landlords, cafés, and the service sector all feel it.

What the coverage doesn't dwell on: the cuts are a response to empty seats, not just a policy choice. Programs that couldn't fill their classes were the obvious targets. The real question is whether fewer, better-filled programs beat more half-empty ones — and whether access to higher education narrows for the students who need it most.

ACC 82%BIAS 10%MID

Kocaeli residents shout down urban renewal: 'taking from the poor, giving to the rich'

Nokta Gazetesi · 2026-08-03

Residents at a Büyükşehir urban transformation meeting rejected the project as 'taking from the poor and giving to the rich.'

The meeting, reported by Nokta Gazetesi, turned hostile

industry.

The numbers flatter, though. Holding a share is not the same as growing. What the headline omits: the sector is staring at a global EV transition and a soft export market, and Kocaeli's factories are the canary for the national industry's next decade.

If the province's plants slow, the ripple hits suppliers, logistics, and jobs far beyond the assembly line. The share is stable today; the direction of travel is the story worth watching.

ACC 78% | BIAS 10% | MID

Kocaeli scraps 142-bus, 70-line public transport tender

Kocaeli Gazetesi · 2026-08-01

Kocaeli has canceled a public transport tender covering 142 vehicles, 70 lines, and 10 million kilometers a year.

The cancellation, reported by Kocaeli Gazetesi, throws the city's bus network into limbo. A tender that size shapes how hundreds of thousands of people get to work every day.

The reasons for the pullback are thin in the coverage — no clear explanation of what went wrong or what comes next. That silence matters, because a gap between the old contract and a new one means service uncertainty on routes people ride daily.

What the story doesn't tell you is the cost: both the money already spent on the process and the price of a network left in suspension. Commuters will feel the answer before the paperwork explains it.

İNSAN & GÜLMECE

Human & Absurd — the lighter side that still says something true

This week's lighter stories share a quiet theme: ordinary people doing small, stubborn, human things — healing a crow, declaring a kid-sized nation, pranking a groom, herding goats toward a law career — that each say something true about loyalty, imagination, and grit.

| Connecting dots: The goat-herding exam scorer connects to the macro beat on education and rural inequality: the same material conditions that make his achievement remarkable are the ones the system hasn't fixed. The crow story and the boy's self-made country both turn on the same dialectic — the 'I' only makes sense inside a 'We.'

The Crow That Wouldn't Leave

NTV · 2026-08-02

A man in Bursa nursed an injured crow back to health. The

as residents demanded guarantees before demolition. The core dispute is who benefits: renewal promises safer buildings, but residents fear displacement and costs they can't carry.

The municipality frames it as earthquake safety; residents frame it as a land grab. Both have a point. The 1999 quake is a live memory here, and so is the pattern of renewal pricing out original owners.

What's missing from the official account: concrete numbers on who pays, who profits, and what happens to those who can't. Until those figures are public, the shouting match is unlikely to settle into a plan.

ACC 78% | BIAS 15% | MID

A 13-Year-Old Declares Independence

Sözcü · 2026-08-01

A 13-year-old in Samsun has founded his own country,

crow has repaid him with permanent company.

He found the bird wounded, took it in, and fed it until it could fly again. It flew — and came straight back. Now the crow follows him everywhere, refusing to be apart. NTV reports the story as a local oddity, but it reads like a fable. Crows are among the smartest birds, known to remember faces, hold grudges, and, apparently, keep loyalties. The man didn't set out to adopt a pet. He just did the decent thing. The crow decided the rest. It's a small story, and that's the point: kindness, returned, with no contract attached.

ACC 80% BIAS 10% MID

The Wedding Gift That Was a Junk Car

Halk TV · 2026-08-03

At a wedding in Nevşehir, the groom's friends gave him a scrap car. He reportedly did a double take.

The friends rolled up with a beat-up junker as the wedding present. The groom turned, looked again, and — per local reports — couldn't quite believe it. It's the kind of prank that only works between people who know each other too well. A new car says 'congratulations.' A scrap car says 'we know you, and we love you anyway.' The humor is the point, but so is the friendship underneath it. Weddings are full of expensive, forgettable gifts. This one, at least, nobody will forget.

ACC 80% BIAS 5% MID

complete with a flag, a currency, and a constitution.

Aras drew his borders with imagination. His self-declared state has a flag, its own money, and a written constitution — governance, one assumes, with no tax authority and unlimited recess. Sözcü reports it with the delight it deserves. It's easy to laugh at a kid playing nation-builder. But the joke has a spine: sovereignty is, at bottom, a story people agree to tell. Aras just skipped the centuries of war and paperwork. The real countries might take notes on the efficiency.

He Herded Goats and Topped the University Exam

Halk TV · 2026-08-01

A student who spent his days herding goats placed near the top of Turkey's university entrance exam. He wants to be a fair judge.

While many students drilled in prep courses, this one was on a hillside with goats. He still finished near the top of the YKS, and told reporters his goal is to become a fair judge. The story is a quiet rebuke to the idea that a good education requires money and a desk. It's also a reminder of what's stacked against rural students — and what raw ability can do anyway. One kid, some goats, and a dream of justice. The system should be asking why it took so much grit to get there.

ACC 80% BIAS 15% MID

SECTION UNDERGROUND ALPHA & ARBITRAGE

THE STATE IS SELLING KOCAELI DIRT CHEAP.

READ THE AUCTION CALENDAR.

Three plays where a public calendar, a grant form, or a free model is the whole edge.

The Kocaeli cluster this week is one story wearing three hats: the state is dumping land at auction and subsidizing renovation at below-market terms, and the people who read the ihale calendar get paid. Grants and state land are the same pipeline, and the smart money stacks them.

| Connecting dots: The TOKİ land auction play feeds directly into the urban-transformation grant beat — a buyer can purchase state land at the hammer and then get the state to fund half the build on it. That stacking of state subsidy on state land is the structural incentive the local beat keeps circling.

The State Is Selling Kocaeli Dirt Below Market. Again.

İlke Kocaeli Gazetesi · 2026-08-01

TOKİ is auctioning 19 plots in Kocaeli inside a 741-plot, 49-

Kocaeli Will Pay Half Your Renovation Bill

Kocaeli Büyükşehir (Instagram) · 2026-07-20

Kocaeli Büyükşehir is covering 50% of urban transformation

province sale, with Çayirova alone listing 11 and Milli Emlak costs through hibe grants, with subsidized kredi on top. separately putting 9 treasury plots on the block.

State land auctions clear below market for a reason: installment payment terms thin the bidder pool, and most retail buyers never read the ihale calendar. The edge is the spread between the hammer price and what a developer pays for titled, serviced land. Buy at auction, hold through the zoning, flip to a builder. The risk is real — auction competition can erase the gap, and a plot with no road access is a plot with no exit. The exit is the flip: sell to a developer once the title clears, or build and sell units. The window is the auction date, and it is public. Başiskele's 5.45 million TL plot is the one to watch; the others are noise until the title work is done.

≈ \$65000 value

- Check the TOKİ ihale calendar for Kocaeli plot dates
- Inspect title and road access before bidding
- Bid at auction, pay installments, flip to developer after title clears

ACC 70% | BIAS 20% | MID

The mechanism is a structural subsidy: the state pays half your renovation bill to get earthquake-risk stock rebuilt, and the rebuilt unit revalues above the sum of grant plus your share. The edge is stacking — the grant applies to the same parcels TOKİ and Milli Emlak are auctioning, so a buyer can buy state land cheap and then get the state to fund half the build. That is two layers of subsidy on one asset. The risk is bureaucracy: eligibility rules, inspection delays, and the gap between announced and disbursed funds. The exit is the revalued unit, sold or rented after completion. Treat the grant as margin, not profit — the spread is only real if the build finishes on schedule and the title is clean.

≈ \$30000 value

- Confirm eligibility for the 50% hibe program
- Match grant parcels against TOKİ auction lots
- Submit application, complete build, sell or rent the revalued unit

ACC 60% | BIAS 25% | LOW

A Turkish Startup Just Got Meta to Fund Its Counterfeit Radar

Instagram / BTM · 2026-07-15

BTM-incubated Counterfake won Meta's Llama Impact grant to build AI counterfeit detection.

The play is not the grant size — it is what the grant buys: free access to Meta's open-weight Llama models, a credibility stamp, and a reference customer. Counterfeit detection is a real market; Turkish brands lose billions to fakes. The cost of building the detector just dropped to near zero because the foundation model is free. The edge is that Counterfake gets enterprise-grade AI at grant-funded cost while incumbents pay for it. The risk is that a grant is not revenue; execution and sales still decide. The exit is enterprise contracts with brands and marketplaces. Speculation: whether the grant converts to paying customers is unproven — treat the win as a signal, not a check.

≈ \$50000 value

- Track Counterfake's enterprise contract announcements
- Watch for marketplace and brand pilot deals
- Assess whether grant-funded build converts to recurring revenue

ACC 75% | BIAS 15% | MID

SECTION OPEN-SOURCE-AI-TOOLS-RADAR

OPEN-SOURCE & AI TOOLS RADAR

This week's radar is dominated by open-weights models — Turkish-language LLMs and TTS plus frontier-scale open models — all pushing self-hostability and cost down for the solo operator.

| *Connecting dots: Mizan-27B and FreyaTTS connect to the local beat: domestic, self-hosted AI that keeps data and costs in Türkiye, while Kimi K3 and MiniMax-M1 tie to the macro story of open-weight models pressuring frontier pricing.*

Mizan-27B: A Turkish Law LLM, Open Weights

Hayat Teknoloji · 2026-08-04

A 27B model trained on Turkish legal texts is now open source, giving local firms and solo practitioners a self-hostable alternative to foreign APIs.

Turkish law is dense, jargon-heavy, and mostly untranslated. Mizan-27B is a 27-billion-parameter model released with open weights, trained specifically on Türkiye's legal corpus. For a solo practitioner or small firm, that means drafting and research on your own hardware, with client files never leaving the building. No per-token fees, no foreign API. The license is open per the announcement. The honest caveat: it's a young model, legal work demands verification, and 27B still wants a serious GPU to run locally. But the direction matters — a domestic model for a domestic domain, self-hosted and TRY-friendly.

ACC 70% | BIAS 10% | MID

MiniMax-M1: Open Weights, Hybrid Attention, Reasoning

MiniMax · 2026-08-03

MiniMax claims the first open-source, large-scale hybrid-attention reasoning model, and it runs on consumer GPUs.

MiniMax-M1 is billed as the world's first open-source, large-scale hybrid-attention reasoning model. Hybrid attention mixes full and linear attention to cut memory and cost, which is what lets a big reasoning model run on hardware a solo operator can actually afford. Open weights mean you can self-host and fine-tune. The caveat: 'first' claims in AI marketing deserve a skeptical read, and hybrid-attention quality at scale is still being proven in the wild. But the trend is real — reasoning models are coming down to consumer hardware, and that changes who gets to run them.

ACC 60% | BIAS 20% | MID

Tabby: A Self-Hosted Coding Assistant That Keeps Code In-House

GitHub · 2026-08-01

Tabby is a self-hosted AI coding assistant, a drop-in alternative to Copilot that runs on your own hardware.

FreyaTTS: A Turkish Voice Model That Speaks the Language

N24 · 2026-08-04

N24 released FreyaTTS, an open-source Turkish text-to-speech model, filling a gap where most TTS tools mangle Turkish phonetics.

Most TTS engines treat Turkish as an afterthought, mangling its vowel harmony and suffixes. FreyaTTS is an open-source, locally runnable Turkish voice model from N24. For a solo operator building a Turkish-language product — a voice assistant, an IVR, a content pipeline — it removes a licensing cost and a data-privacy headache. Run it on your own box, no per-character fees. The caveat: TTS quality is subjective, and early releases often need tuning; listen to the demo before committing. Still, a domestic, self-hostable voice model is exactly the kind of tool that keeps costs in lira and data in-country.

ACC 65% | BIAS 15% | MID

Kimi K3: 2.8 Trillion Parameters, Open Weights

Backgrind · 2026-08-03

Moonshot AI released Kimi K3 with open weights and a 2.8T parameter count, and it's already being benchmarked against frontier models.

Moonshot AI's Kimi K3 landed with open weights and a reported 2.8 trillion parameters, and early benchmarks put it in the same conversation as OpenAI and Anthropic's frontier models. For a solo operator, open weights at that scale mean you're not locked to one vendor's API pricing. The caveat: 2.8T parameters is not something you run on a laptop — you'll rent or use an API, and the 'rivals frontier models' claims are vendor-adjacent. Still, it's a signal that open-weight models now compete at the top, and that keeps prices honest.

ACC 60% | BIAS 20% | MID

Tabby is a self-hosted AI coding assistant that runs on your own hardware, a direct alternative to GitHub Copilot. For a solo developer in Türkiye, that means no per-seat subscription, no code leaving your machine, and full control over the model. It supports local models and can be tuned to your stack. The caveat: self-hosting means you own the GPU cost and the maintenance, and a mid-range setup won't match a cloud assistant's latency. But for privacy-sensitive or cost-conscious work, it's a mature option with real adoption and steady momentum.

ACC 80% | BIAS 5% | HIGH

SECTION OPPORTUNITY-PERK-RADAR

THE FREE-MONEY FILE: TURKISH STATE VAULTS

AND CLOUD GIVEAWAYS

Where the real value hides this week — and where it's just a free smoothie

This week's real value sits in Turkish state programs — KOSGEB's interest-free AI credit and its sectoral transformation grants — plus the always-free cloud tiers that cost nothing but a filled-out form. The consumer freebies are pocket change by comparison, but they're real and they repeat.

| *Connecting dots: The KOSGEB AI credit and Google Cloud's startup credits feed the same machine: cheap compute for small builders. That ties straight into the edition's macro beat on Turkey's startup ecosystem, where state money and cloud credits are quietly doing the heavy lifting that venture capital isn't.*

KOSGEB's interest-free AI credit: up to 5 million lira for tech ventures

KOSGEB · 2026-06-13

KOSGEB opened its vault for AI builders in June 2026: up to 5 million Turkish lira in interest-free financing for startups and SMEs shipping artificial intelligence products.

The directive, dated June 13, 2026, targets exactly the small shop that usually can't touch bank credit. It's a loan, not a gift — but at current Turkish rates, the interest you don't pay is the real prize. The program is aimed at technology ventures with a working AI angle, and applications run through KOSGEB's own portal. Sources say the program is live and taking applications; the June directive is public on KOSGEB's site. Verify your eligibility before you count the money, because KOSGEB's criteria shift and the paperwork is thick. The headline number is 5 million lira, but the honest value is the interest subsidy on that plan, and your numbers. The value is real and large, but it's not sum over the loan's life — real money, but not free money. Treat it as cheap capital, not a windfall.

≈ \$25000 value

KOSGEB's sectoral grant: up to 6.5 million lira a year for digital transformation

Müşavirler Kulübü / KOSGEB · 2026-01-01

KOSGEB's Sectoral Development Center program hands SMEs up to 6.5 million lira a year in grants — not a loan, a hibe — for dragging a small business into the digital age. The 2026 cycle funds the machinery, software, and training that move a small firm online, and the support window stretches ten years, pushing the total toward 65 million lira. This is the rare government program where the paperwork pays for itself. It's a grant, so the money doesn't come back — which is why the competition is stiff and the file is thick. Applications run through KOSGEB, and the program targets SMEs in designated sectors. It's active for 2026. Expect to prove your sector, your plan, and your numbers. The value is real and large, but it's not automatic: this one rewards the organized applicant who reads the manual before calling the consultant.

≈ \$160000 value

- Confirm your business qualifies as an SME or technology venture
- Check that your sector is covered by the Sectoral Development

under KOSGEB's definitions.

- Prepare an AI-focused project proposal with a clear use of the funds.
- Register and apply through KOSGEB's online application system at kosgeb.gov.tr.
- Submit the documents required by the June 13, 2026 directive.
- Await evaluation and approval; expect a review cycle.
- Center program.
- Draft a digital transformation project with costed machinery, software, and training.
- Apply through KOSGEB's online portal.
- Submit the supporting documents and financials.
- Track the evaluation and respond to any requests.

ACC 75% BIAS 15% MID

Google Cloud gives away real compute — free tier plus up to \$350K in startup credits

Google Cloud · 2026-01-01

Google Cloud's always-free tier covers a small VM, storage, and a database at zero cost, and its startup accelerator doles out up to \$350,000 in cloud credits to real companies.

The free tier alone is roughly \$300 a month of infrastructure for nothing, no card required. For startups, the Google for Startups Accelerator — including the MENA-Turkey track — hands out cloud credits that can run to six figures. One Hacker News thread documents a user stacking \$130,000 in GCP credits over three years just by filling out forms. The catch: free-tier limits are modest, and the accelerator credits demand an actual company with a pitch. But the entry cost is a form, not a check. If you're building anything on the internet, this is the cheapest server you'll ever rent. The credits are real and the program is live; just don't expect the big number without a real business behind it.

≈ \$3600 value

- Create a Google Cloud account.
- Enable the always-free tier resources: an e2-micro VM, 30GB of storage, and a database.
- For startup credits, apply to the Google for Startups Accelerator (MENA-Turkey track).
- Fill out the credit request forms and submit your project details.
- Monitor your credit balance and usage.

Türkiye Scholarships: a full ride for international students

Türkiye Scholarships · 2026-01-01

Türkiye Scholarships covers tuition, a monthly stipend, housing, and health insurance for international students — a full ride that adds up to tens of thousands of dollars a year.

It's the state's way of importing talent, and it's open to undergrads, grads, and PhDs from nearly anywhere. The value is

Oracle's always-free tier: two VMs and 24GB of RAM, permanently free

Oracle Cloud · 2026-01-01

Oracle's always-free tier is the quiet heavyweight of free cloud: two AMD VMs, four ARM cores, 24GB of RAM, and 200GB of storage, with no time limit and no card required.

That's a real server you can run a business or a side project on for nothing, forever. The ARM instances are the prize — they're genuinely useful, not a teaser. Oracle has run this program for years and it keeps working. The main friction is availability: free ARM capacity comes and goes, so you grab it when it's there. Sign up, claim your instances, and you've got infrastructure that would otherwise cost a few hundred dollars a month. It's the best kept secret in the free-cloud game, and it costs nothing but patience. If you've been paying a hosting bill for a small project, this is the fix.

≈ \$3600 value

- Sign up for an Oracle Cloud account.
- Navigate to the Always Free resources section.
- Create your free AMD and ARM compute instances.
- Watch for ARM capacity availability and claim it when it appears.
- Set up your storage and database within the free limits.

ACC 85% BIAS 5% HIGH

large and real: tuition plus a living stipend plus housing, plus a year of Turkish language study. Applications open annually through turkiyeburslari.gov.tr, and there is no fee to apply — anyone charging you to 'help' is running a scam. It's competitive, and selection favors applicants who can show why they matter. If you're a student looking at Turkey, this is the single best door in. The paperwork is heavy and the wait is long, but the payoff is a degree and a stipend with no debt attached.

≈ \$15000 value

- Check your eligibility on turkiyeburslari.gov.tr.
- Prepare transcripts, diplomas, and a personal statement.
- Apply online during the annual application window.
- Await selection and university placement.
- Accept the offer and complete the visa and registration steps.

ACC 85% | BIAS 5% | HIGH

THE EDITORIAL

The week's cleanest signal came from a crowd in Kocaeli shouting that urban renewal takes from the poor and gives to the rich. That is not noise; it is the ledger made visible. The same state that tightens rates to cool inflation hands out interest-free credit and cancels student-loan interest. It sells land below market and pays half your renovation — then scraps the bus tender. None of this is hypocrisy; it is a state pulling in two directions at once, and the contradiction lands on whoever is least able to absorb it. We do not print the loudest story; we print the one with the most leverage. This week that is the gap between the headline and the structure. Watch the fine print. The fine print is where the real policy lives.
